

Scottyab/rootbeer Executive Summary

The amount of people working on this project in the most recent weeks has reduced significantly. We focused on mostly Java and Kotlin files, and trying our best to fix bugs. Some current issues include compatibility for specific Android devices, and Google Play store fixes. Another issue is selinux flag giving false positive. It is not only the selinux, but also other false positives caused by dangerous props. However, we are working on these bug fixes quite often, making a few commits at least once every 2 weeks. The following is a scatter plot showing the author file touches for the rootbeer repository and focusing only on source files. Each color represents a different author.
